

# Neelam's Digital Register

# INTRO

- The database holding the details of patients of hospital, built using C language

# Problem

- I've visited many hospitals where they maintain the records in a register and it becomes so difficult for them to add new records, find patient's details, edit record etc.

# Solution

- Solution to this problem is an online record maintainer . This would decrease human effort and help in saving the data which is easy to operate. So here comes Neelam's digital register.

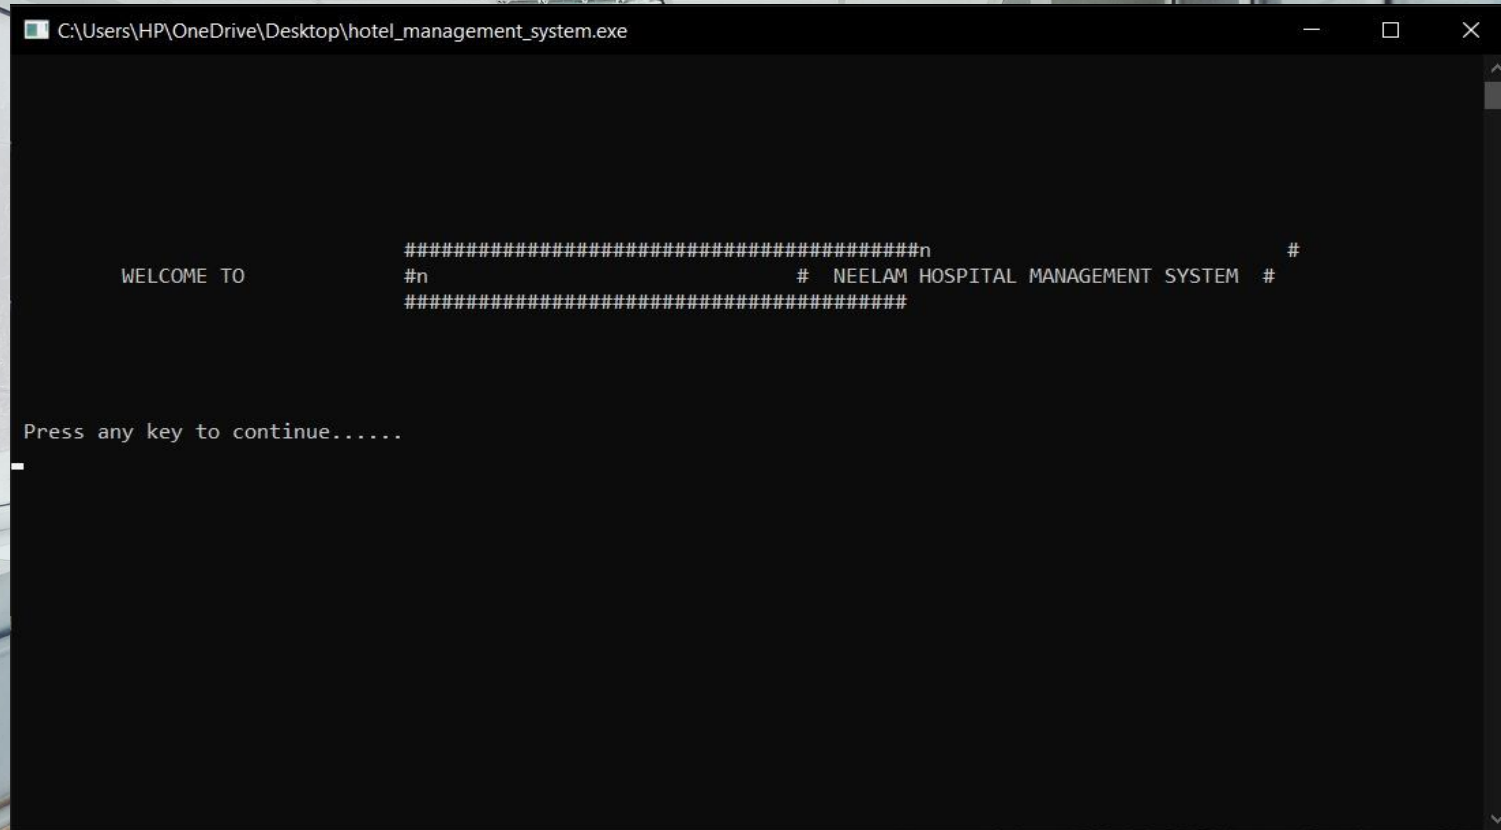

# Objective

- It is designed to save the data of the patients who approach the hospital for their treatment. The data filled would be systematically saved in a file(using file handling). The patient records would be easily accessible even if the patient approaches the hospital after a long duration of time.

# How it Works?

```
C:\Users\HP\OneDrive\Desktop\hotel_management_system.exe

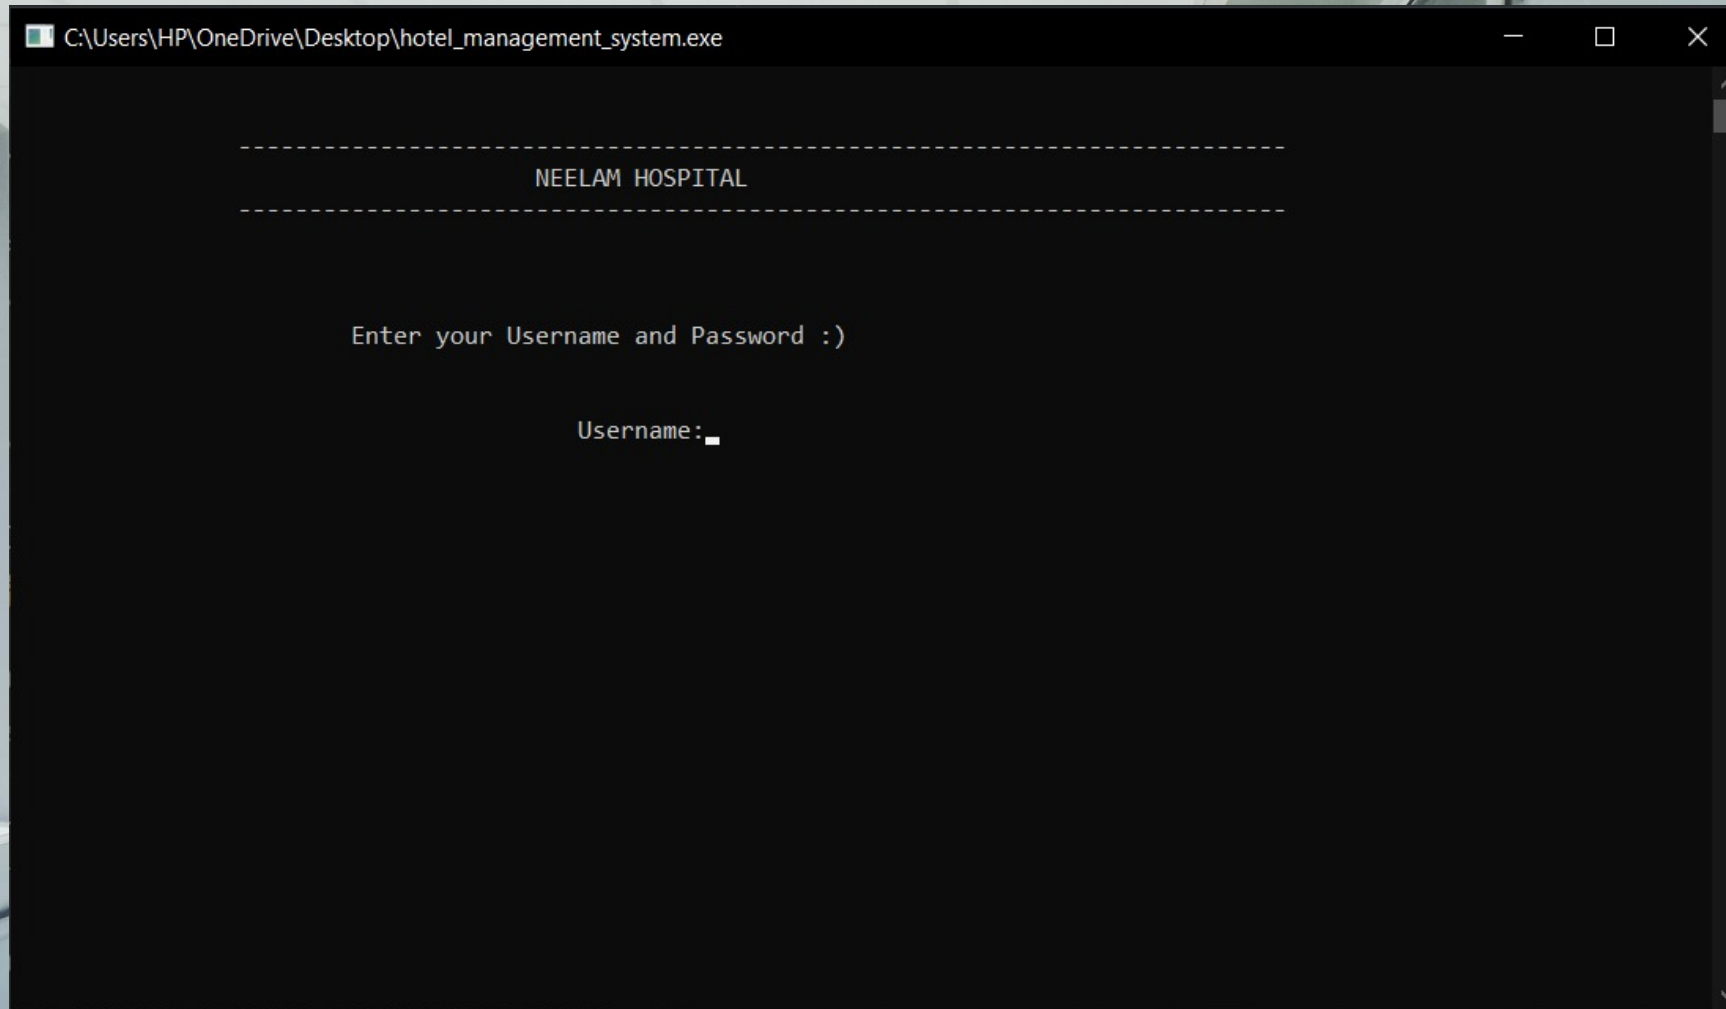

WELCOME TO

#####n#
#n# NEELAM HOSPITAL MANAGEMENT SYSTEM #
#####

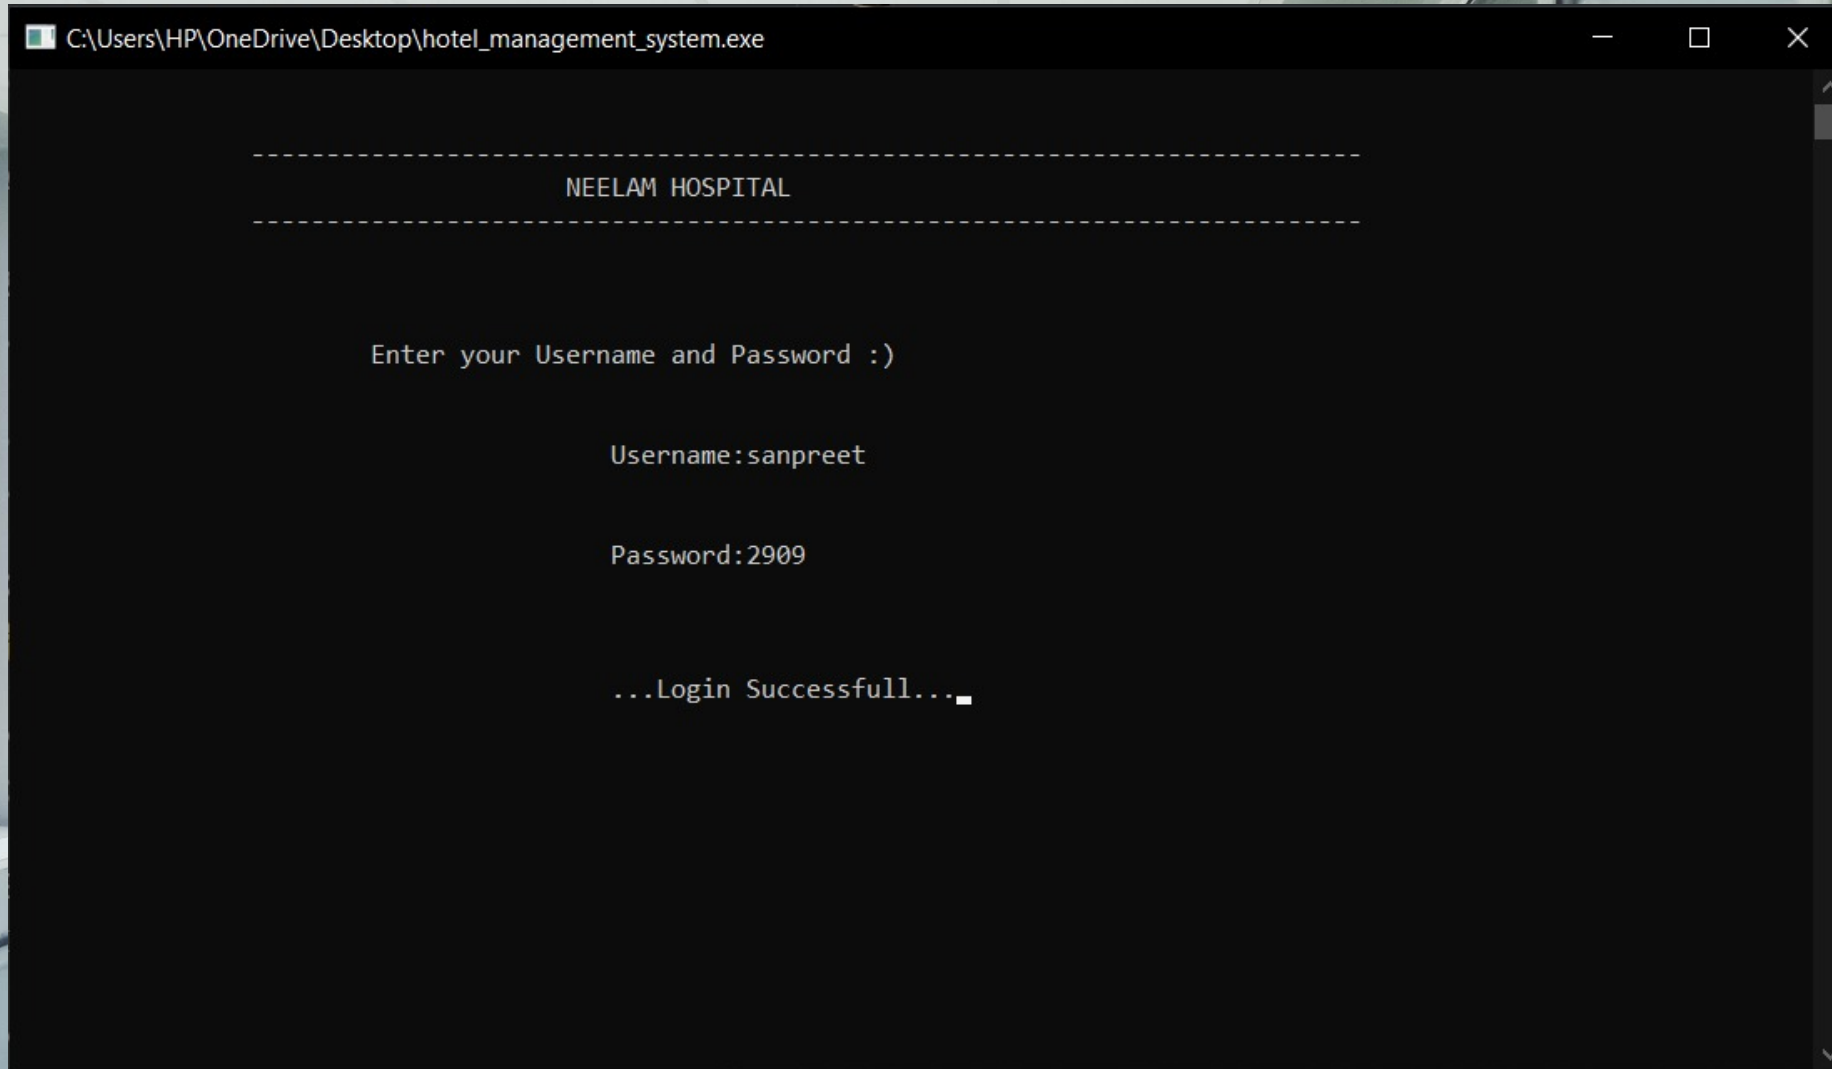

Press any key to continue.....
```

A prompt will appear as the pre login page as shown above.

The login page will appear as soon as any key is pressed.

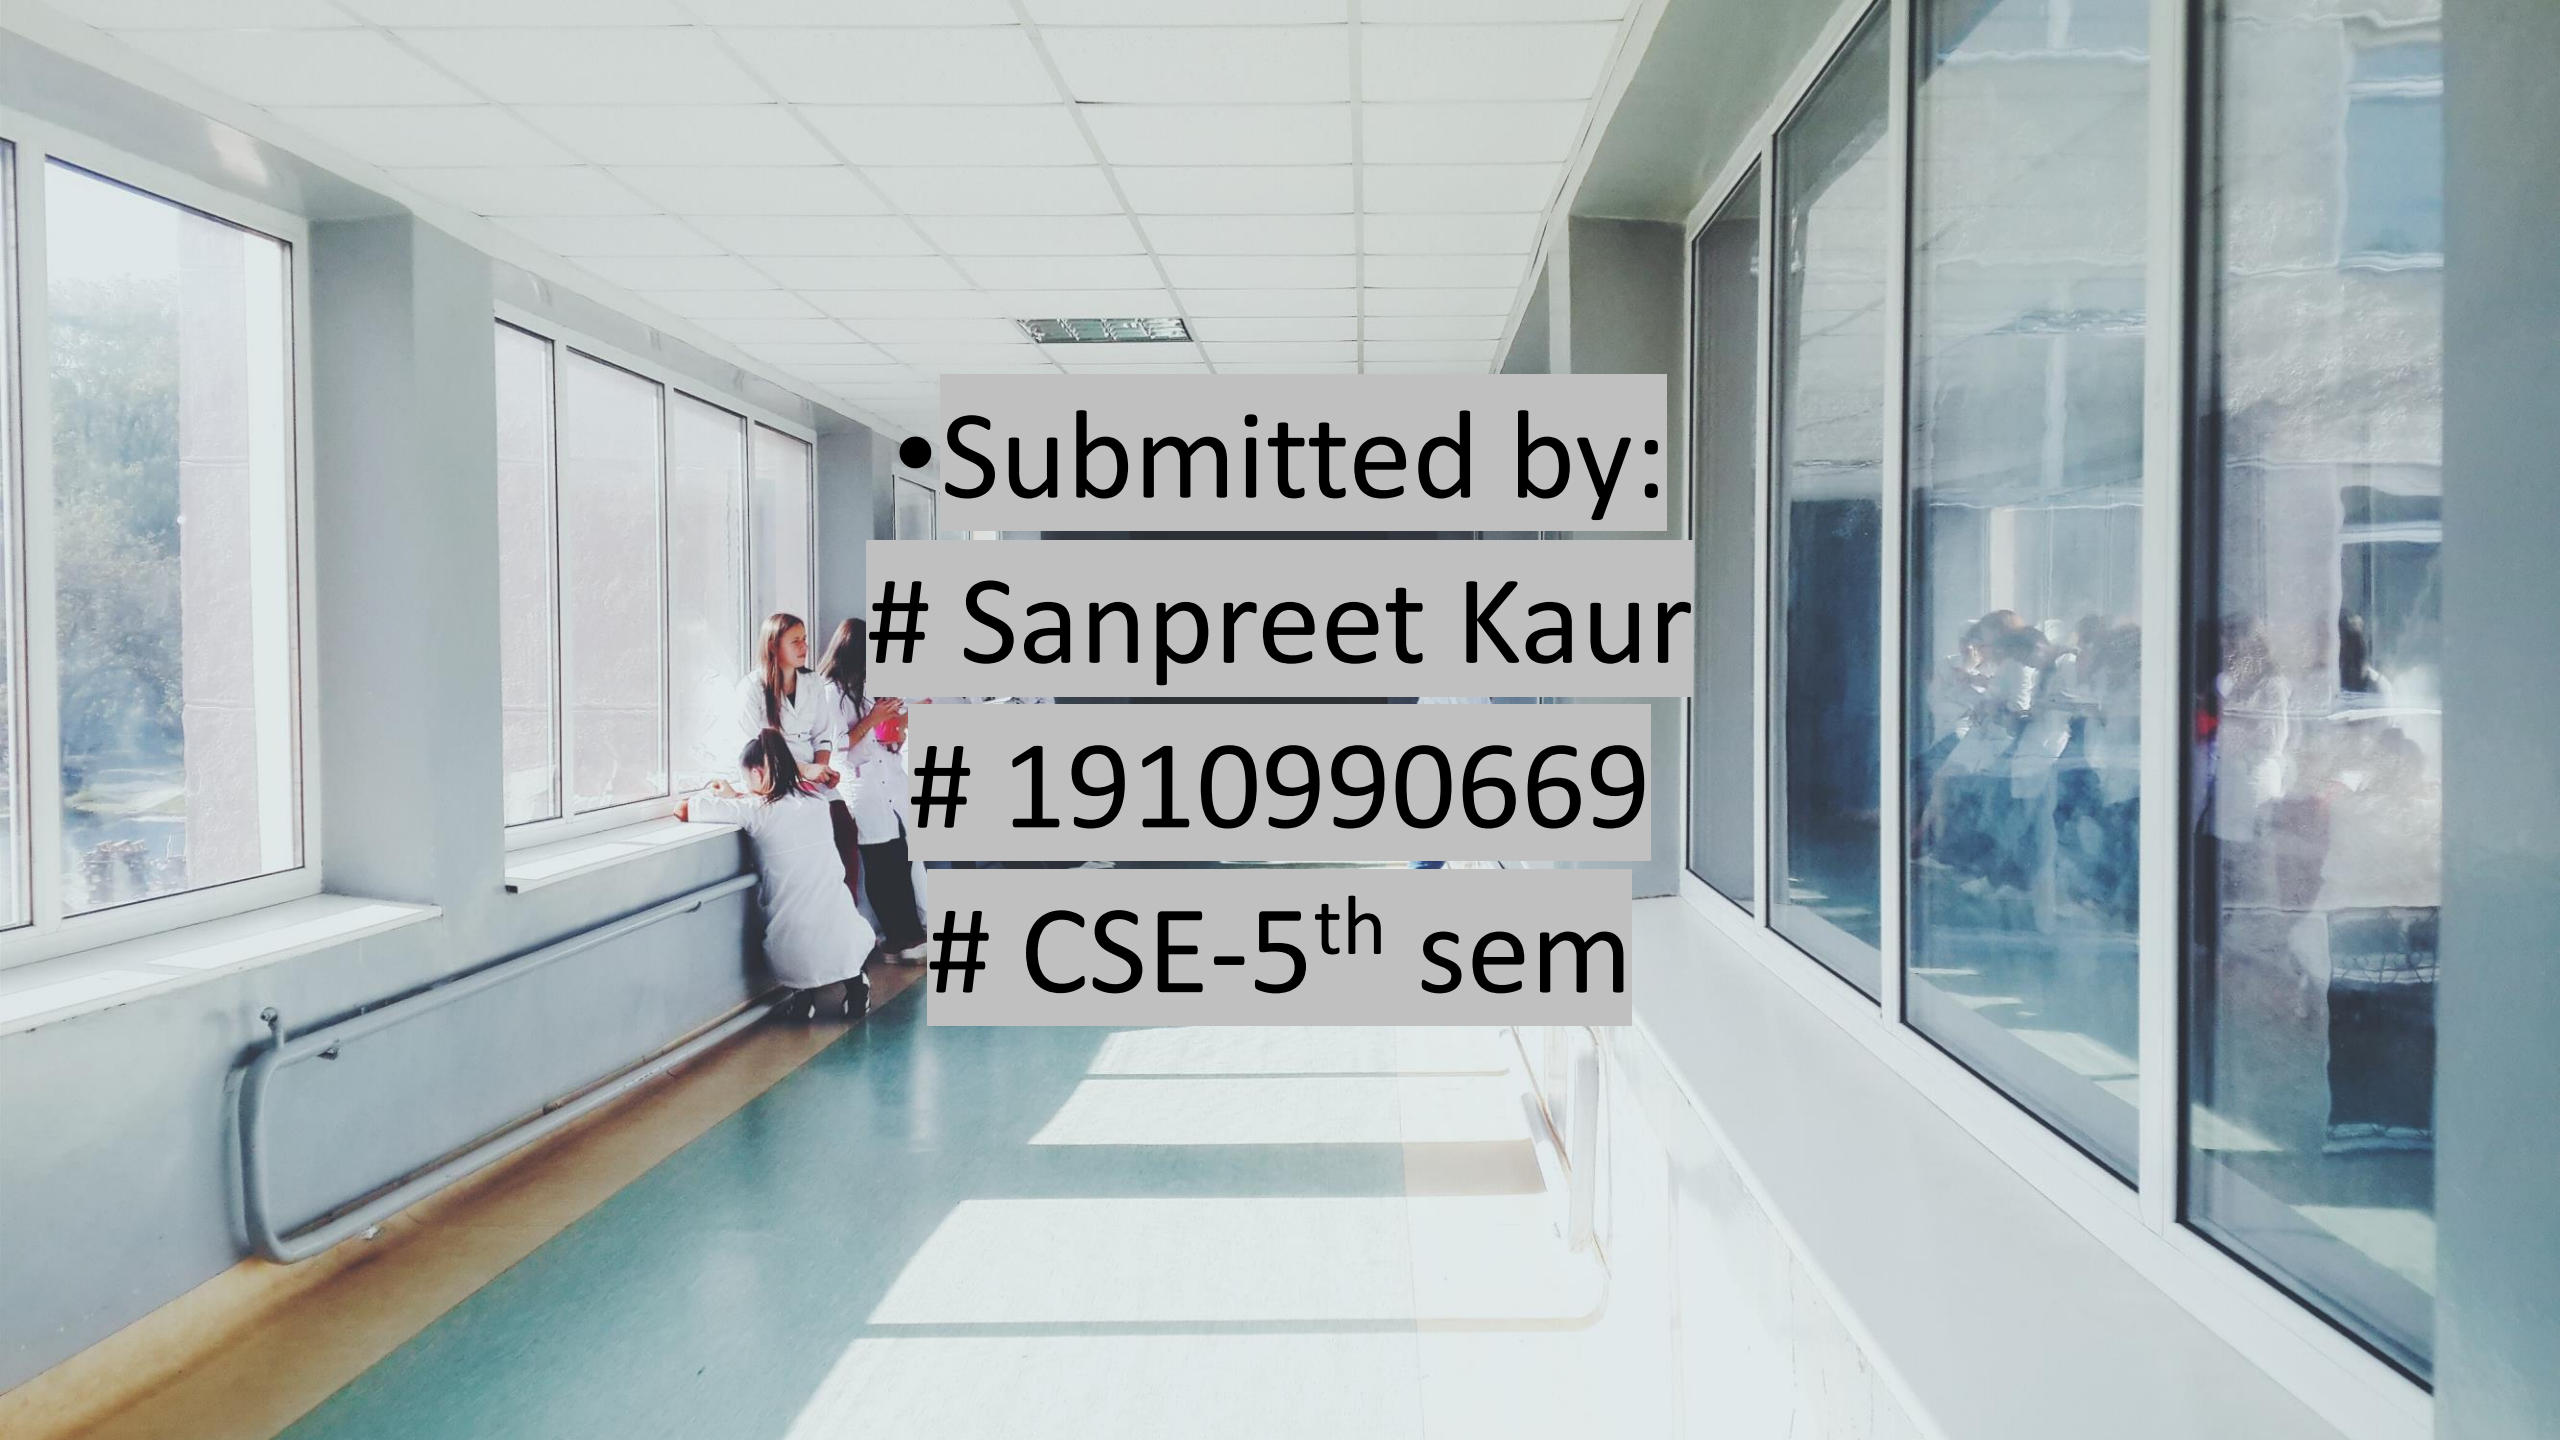

After filling the appropriate user credentials, the login would be successful

After successfully logging in, the following options would appear and the data would be saved respectively.
